

WATERGATE OF ALEXANDRIA

WINTERIZATION

NOVEMBER 2018

We wish to remind you of the following important winterization items. Please make note of these items to avoid discomfort and expense this winter.

FIREPLACES

Do not burn Duraflame or other manufactured logs in your fireplace. Watergate fireplaces are "zero clearance" pre-fabricated fireplaces rather than masonry fireplaces. The manufacturer did not design the fireplaces to handle the intense heat generated by artificial logs, which can damage or crack the firebox and create a fire hazard.

CHIMNEY INSPECTION

Our insurance company (Travelers') asks that you have your chimneys inspected and cleaned, regularly. Chimney sweeps are relatively inexpensive and available in the area. Inspecting and cleaning your chimney is a good idea for your own safety and that of the entire community. See the [Service Providers](#) page of the website for suggestions.

OUTSIDE FAUCETS

As the cold weather approaches, we must winterize exterior water faucets. To accomplish this, you must determine the type of faucet(s) you have. There are three possibilities.

Standard: You will find the turn-off valve inside the unit either in the closet housing the water heater or under the kitchen sink. Once you have turned the faucet off inside, open the faucet on the outside. This will allow the remaining water to drain and prevent freezing and possible broken pipes. We recommend that once drained, you leave the outside faucet open throughout the winter. Insulating covers for these faucets are inexpensive and are available at hardware stores and home centers.

Frost proof: Although the name implies that draining this type is not necessary, servicing these faucets is important each winter. Two metal rings surround the water faucet. The top ring must be turned and pushed up, allowing the water in the pipe to drain out. It is not necessary to turn off the water inside; however, the Association recommends that you do so as a safety precaution. The top ring, which is turned and pushed up, must remain in the up position.

Patio floor: A patio floor faucet is designed to automatically winterize itself when normally turned off. Staff will turn these off at the water elements. If you have this type of faucet, you need only ensure that staff have turned the water off securely.

GARAGE DOOR ELECTRIC EYES

Return of cold and wet weather may cause moisture to build up on the reflectors, which generate

the electric-eye garage door openers. Occasionally, fog or moisture will cause a film on the reflector that interrupts the electric-eye beam. If the doors do not open or close, try wiping off the red reflector at the bottom of each door with a dry cloth before reporting a garage breakdown.

HEAT PUMPS

To ensure proper operation and to prevent damage to exterior heat pumps, it is essential that you clear snow and ice off your unit. Additionally, you should clean or change the filter in the attic air handler frequently. Please note that maintenance of these units is your responsibility.

SNOW AND ICE REMOVAL

When a big storm strikes, there is no simple and quick way to dig out. Oscar Giron, our maintenance supervisor, makes every effort to remove snow and ice in a timely manner. However, clearing the walk in front of your door periodically during a heavy snowstorm can save hours of work for a few minutes of your time. It would be a wonderful gesture if you continued down the walk to clear a path for that neighbor who is unable to do so themselves. We will place a supply of ice melt in each garage for your convenience; please **do not use salt**, as it will damage the plantings and sidewalks.

There are many depressions on our brick walkways that can fill with water that freezes. As we are doing brick and mortar repairs, we are evening out some of these depressions; however, we cannot repair all of these imperfections. Level walking areas and steps can be covered with ice. While Oscar will make every effort to remove ice and snow, he will not always be able to remove all of it, and melting snow and ice will often refreeze. Please exercise care when walking where ice and snow are present.

THERMOSTAT SETTINGS

You must leave some heat on in your unit, even if you are going away for an extended period. If you turn the heat off completely, there is a great danger of frozen pipes. We request that you leave your thermostat turned to **heat** and set no lower than **55-60 degrees**.

We also recommend that you arrange with a neighbor or friend to check your unit on a daily basis during very cold weather as a precaution. Since the Association does not have keys to the units at Watergate and may be unable to contact the owner of a residence during an emergency, the Association will charge you the cost of obtaining access to your unit.

The Board appreciates your assistance and cooperation regarding these matters. If you have questions or you need assistance, please contact a [Board member](#) or [Oscar Giron](#).
